

CLAIMS

1. A sash lock apparatus which comprises:

a keeper disposable on a first window sash and having a keeper aperture therein for lockingly receiving therein a selectively retractable element from a sash lock and said sash lock having said selectively retractable element disposable on a second window sash wherein said first and second window sashes are disposed for movement in a direction parallel to each other, said sash lock including:

(a) a rotatable lever having a tab extending therefrom; and

(b) a spring slide deformable by rotation of said rotatable lever and movement of said tab against said spring slide for selectively causing a portion of said spring slide to enter and retract from said aperture to cause locking and unlocking of said first and second window sashes relative to each other.

2. The apparatus of claim 1 wherein said spring slide includes a central aperture, said tab extending into said central aperture, rotation of said tab with said rotatable lever causing deformation of said spring slide and one of movement of said spring slide into or out of said keeper aperture.

3. The apparatus of claim 1 further including a housing having a shaft secured to said spring slide, said rotatable lever being rotatable about said shaft.

4. The apparatus of claim 2 further including a housing having a shaft secured to said spring slide, said rotatable lever being rotatable about said shaft.

5. The apparatus according to claim 1 wherein said spring slide is a spring steel slide.

6. The apparatus according to claim 2 wherein said spring slide is a spring steel slide.

7. The apparatus according to claim 3 wherein said spring slide is a spring steel slide.

8. The apparatus according to claim 4 wherein said spring slide is a spring steel slide.

9. The apparatus according to claim 3 further including a member having member detents therein and secured to said shaft and rotatable member detents disposed on said rotatable member for entry into at least one selected member detent upon rotation of said rotatable member to one of an open or closed position.

10. The apparatus according to claim 4 further including a member having member detents therein and secured to said shaft and rotatable member detents disposed on said rotatable member for entry into at least one selected member detent upon rotation of said rotatable member to one of an open or closed position.

11. The apparatus according to claim 7 further including a member having member detents therein and secured to said shaft and rotatable member detents disposed

on said rotatable member for entry into at least one selected member detent upon rotation of said rotatable member to one of an open or closed position.

12. The apparatus according to claim 8 further including a member having member detents therein and secured to said shaft and rotatable member detents disposed on said rotatable member for entry into at least one selected member detent upon rotation of said rotatable member to one of an open or closed position.
